

Calculations

For this project, our group opted to construct a **cone** with maximum radius 32" and height, from the xy-plane, 36" (or 2.5" and 3", respectively). The cone was limited to only positive z values, for the sake of construction, and no other domain restrictions were imposed.

Precise Theoretic Value

To calculate the precise theoretic value, we will use a double integral.

Approximate Theoretic Value

To calculate the approximate theoretic value, we will use a Riemann summation.
